Priority Applications (No Type Date): DE 2844124, A 19781010

Abstract (Basic): DE 2844124 A

The coin operated gaming machine uses an illuminated display to simulate the effect of a roulette table, and has a selection facility, that permits the player to control the combination of wagers and the overall odds. The machine has two coin entry points (MS1, MS2) that allow up to three specific wagers to be selected in one play. The main display field has a central annular display in readiness (10) and a segmented display (16, 18, 20, 22) that is illuminated at a controlled rate.

Selectors (Tx) provide a facility to select the odds associated with a specific playing cycle. A manually actuated control (X) initiates repeat cycles that are internally controlled by an N stage counter, that allows repetitive operation up to a max. value.
